The question. Then the evidence.

Data, communications, semiconductors and factories are corporate assets as well as foundations for national strategy. I ask how contracts and institutions turn these capabilities into military, economic and diplomatic options.

READ THE ARGUMENT / CHECK THE SOURCE

Three passages to begin with

Begin with the source passages on corporate survival, changing industry and analytical method. Each opens a question developed in the essay.

S06

Resilience

Excerpt from the author

What needs clarification is that the absence of ESG effectiveness in this analysis is a finding within the corporate-sustainability indicators I operationally defined. Whether ESG management has meaningful social and environmental effects and whether it drives a firm's financial sustainability are separate questions.

S16

Semiconductors

Excerpt from the author

Actual export statistics show both growth in Korea's semiconductor industry and changes across markets. Semiconductor ICT exports reached a record USD 173.48 billion in 2025; the government cited increasing demand for high-value memory from expanding AI data centers as a major factor.

> These figures alone do not establish that export controls caused the decline to China: changing AI demand, chip prices, product mix and national economic conditions could also have contributed.

S17

Defense

Excerpt from the author

The six indicators were z-score normalized and reduced through PCA to two axes: PC1, innovation/margin, and PC2, size/leverage. K-means with k = 2 produced clusters. A weighted combination based on PC1 scores forms the Defense Viability Index.

Methods at a glance

These are methods described in the reports. The methods page distinguishes the supplied material from independently reproduced analysis.
